

The effects of climate change on mountain ecosystems

Bernat Claramunt-López

Researcher

October 26th, 2021

What is a mountain ?

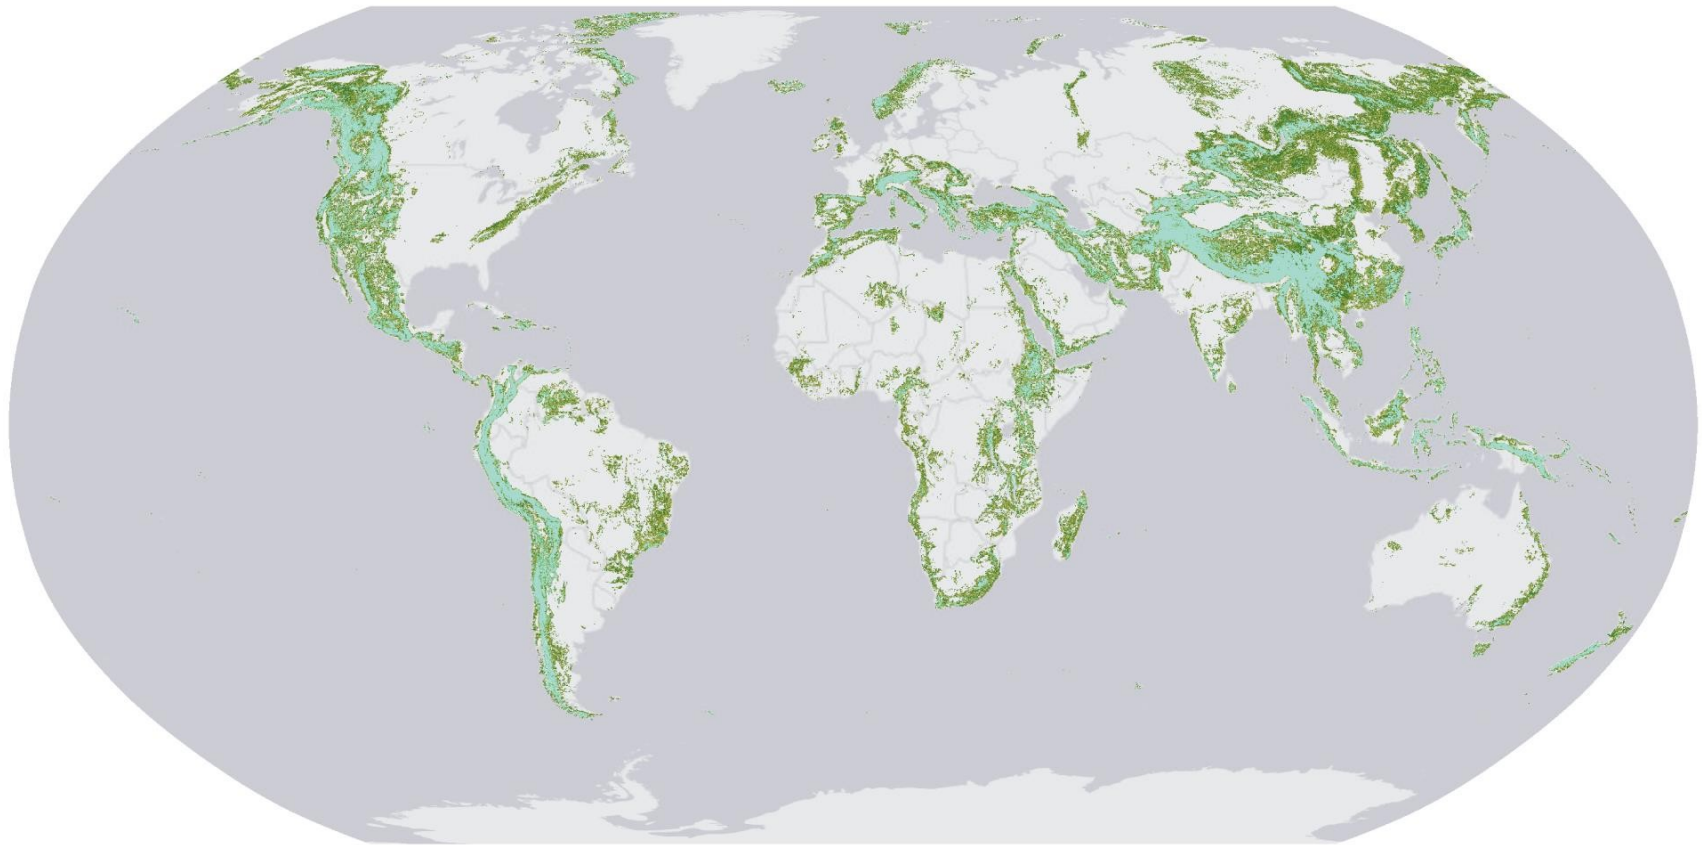

What is a mountain ?

What defines a mountain?

- Slope
- Latitude
- Mostly agricultural
- Local perception
- Mostly rural
- Seasonal presence of snow

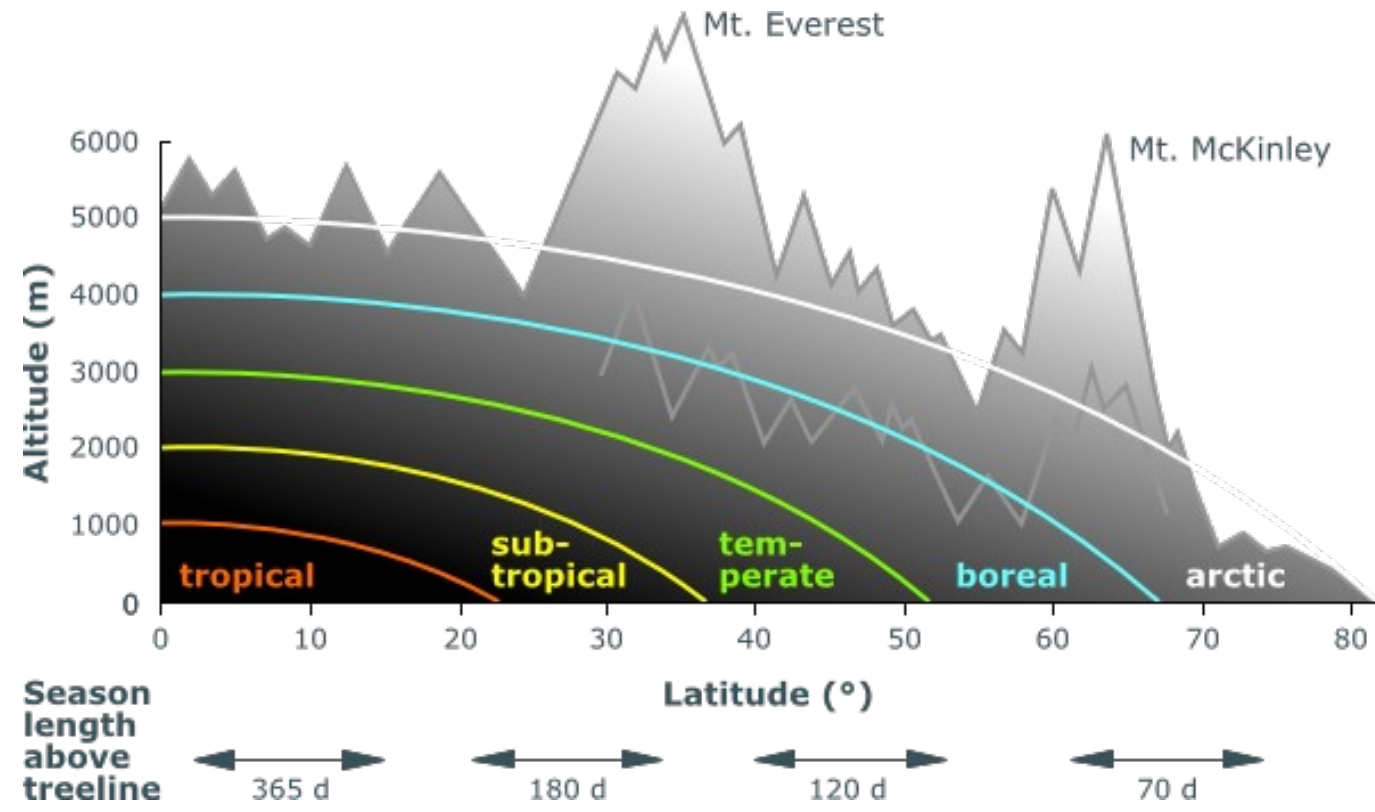

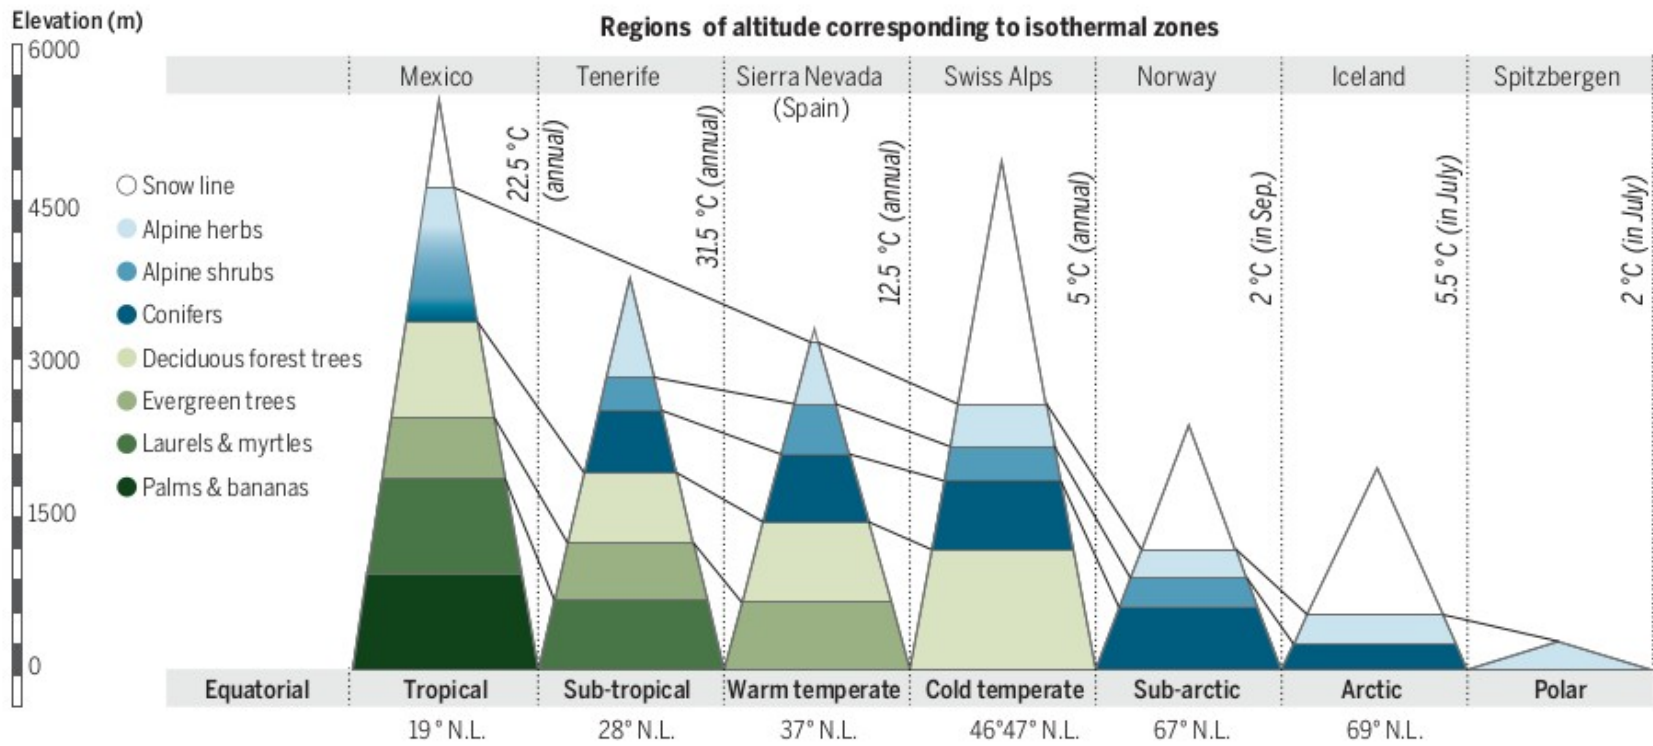

What makes mountains
specially interesting for us?

Climate compression

Compression of climatic zones over short distances otherwise separated by thousands of kilometers of latitude

A tropical mountain may contain all the climatic zones of a single hemisphere.

PM 13.04

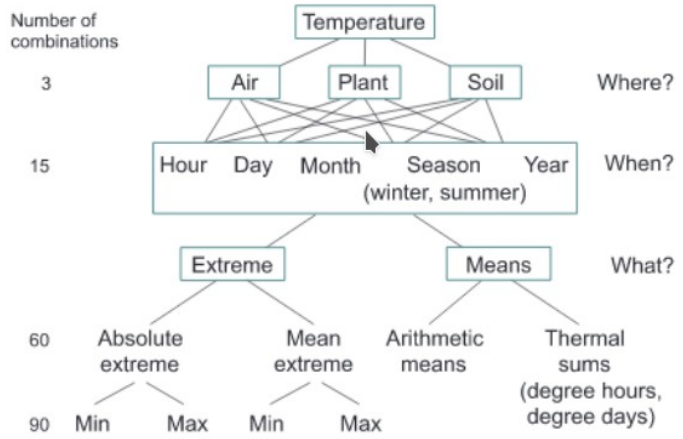

The windward side of a mountain has more precipitation than the leeward (sheltered) side

Rugosity

High environmental diversity

Review

The 90 ways to describe plant temperature[☆]

Climate change in Catalonia

| | | Hivern | Primavera | Estiu | Tardor |
|-----------------------|------------------|--------------------|----------------------|----------------------|----------------------|
| Litoral/ Preitoral | ΔT (°C) | 0,6 (0,0/1,2) | 0,7 (0,1/1,3) | 0,8 (0,2/1,4) | 0,8 (0,4/1,2) |
| | ΔPPT (%) | -0,8 (-4,2/2,6) | -1,5 (-6,9/3,9) | -2,5 (-7,9/2,9) | -7,9 (-27,6/23,4) |
| Interior | ΔT (°C) | 0,6 (0,0/1,2) | 0,7 (0,1/1,3) | 0,8 (0,2/1,4) | 0,8 (0,4/1,2) |
| | ΔPPT (%) | -0,8 (-4,2/2,6) | -1,5 (-6,9/3,9) | -2,5 (-7,9/2,9) | -4,3 (-25,9/26,0) |
| Pirineu | ΔT (°C) | 0,6 (0,0/1,2) | 0,7 (0,1/1,3) | 0,9 (0,5/1,5) | 0,7 (0,4/1,3) |
| | ΔPPT (%) | -0,8 (-4,2/2,6) | -0,8 (-22,9/16,9) | -2,5 (-16,8/11,9) | -2,7 (-23,1/15,8) |

DROUGHT

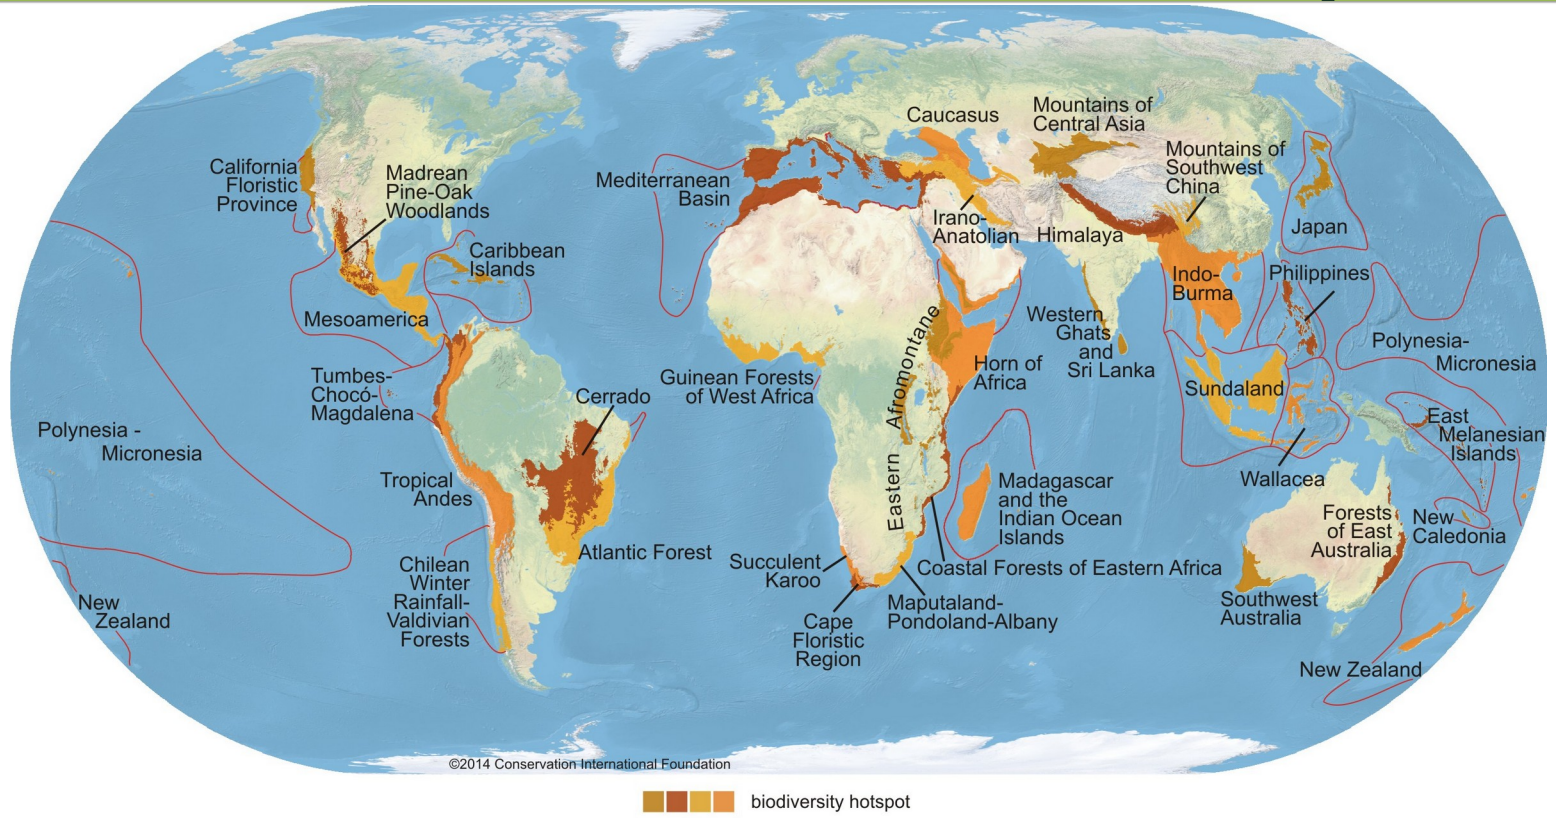

The water towers

Water uses:

- Agriculture
- Biodiversity
- Energy
- Forestry
- Households
- Industry
- Navigation
- Tourism

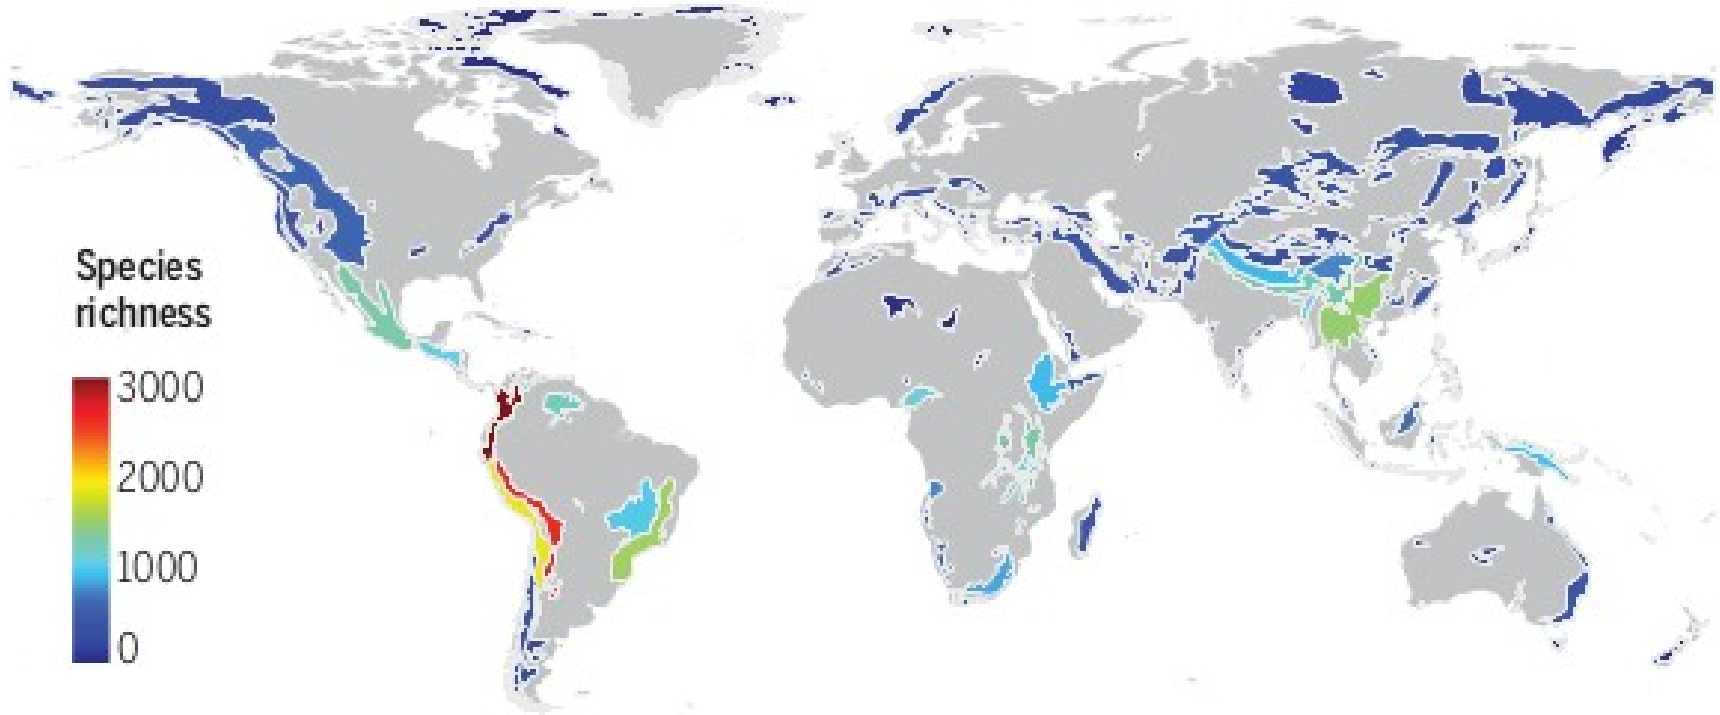

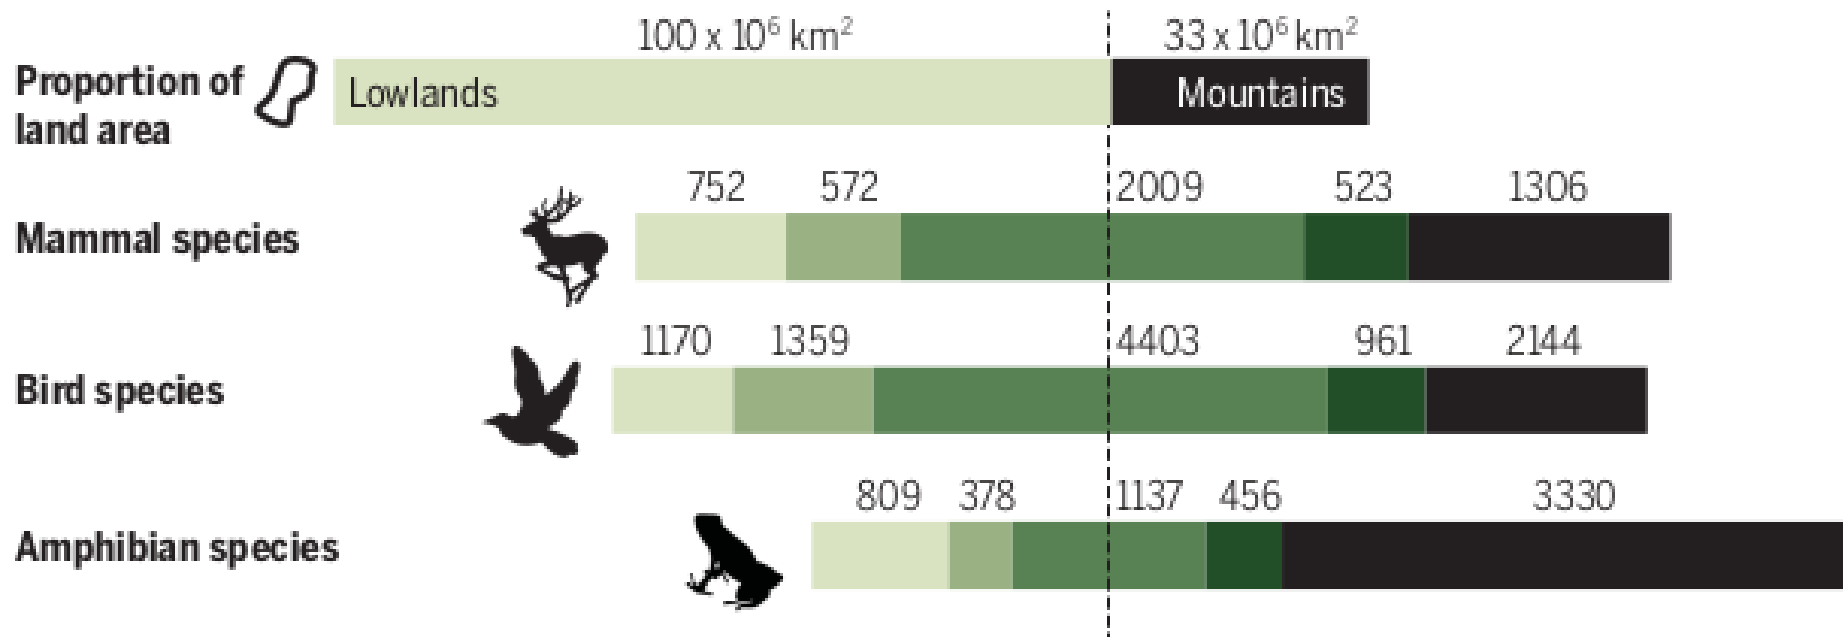

Mountains biodiversity

Mountain regions are home to more than 85% of the world's species of amphibians, birds, and mammals, many entirely restricted to mountains.

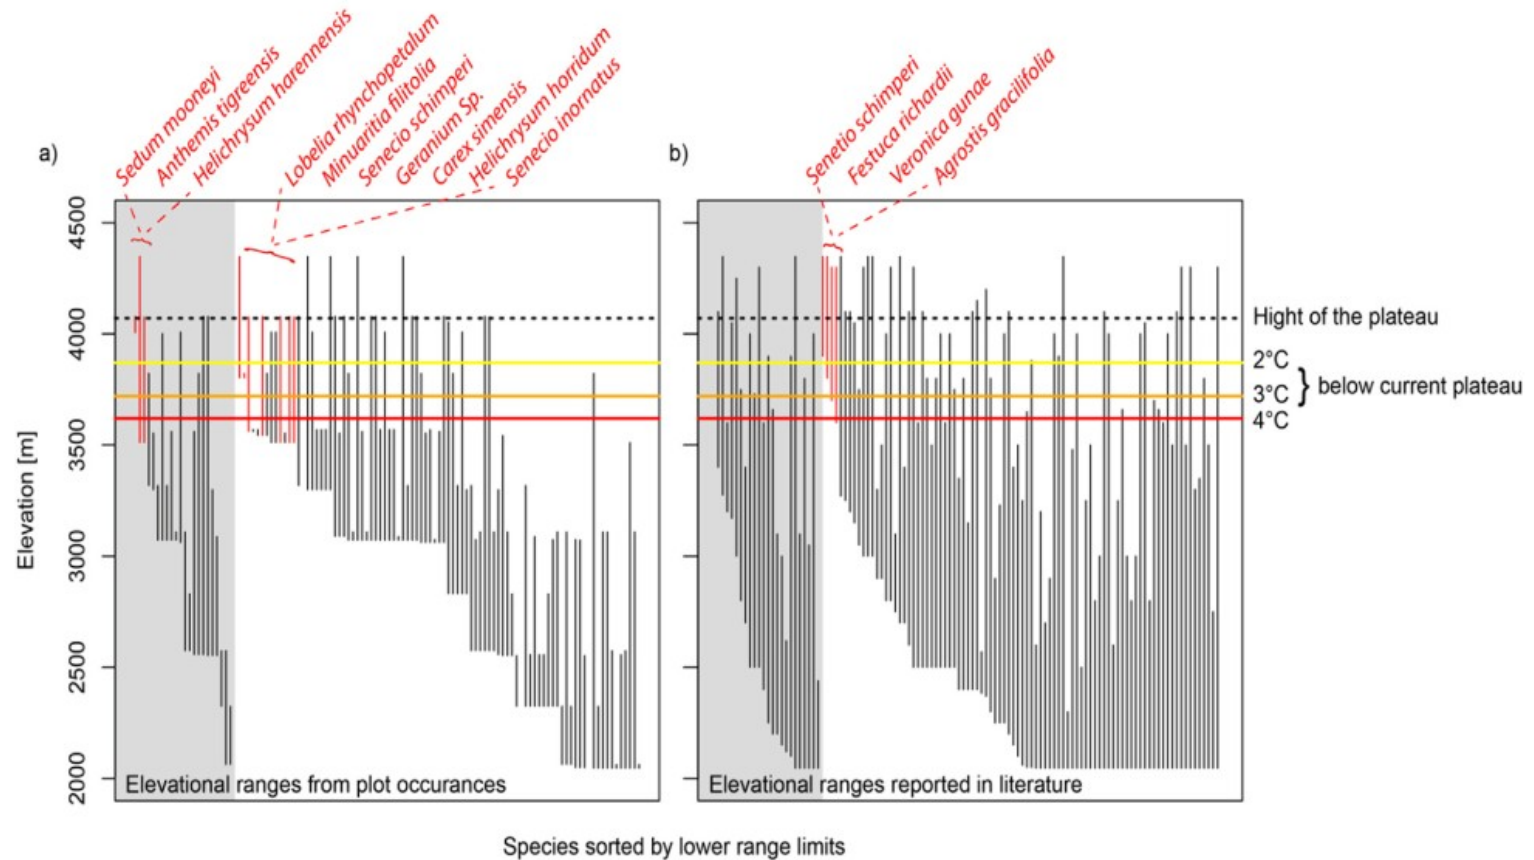

A Species richness

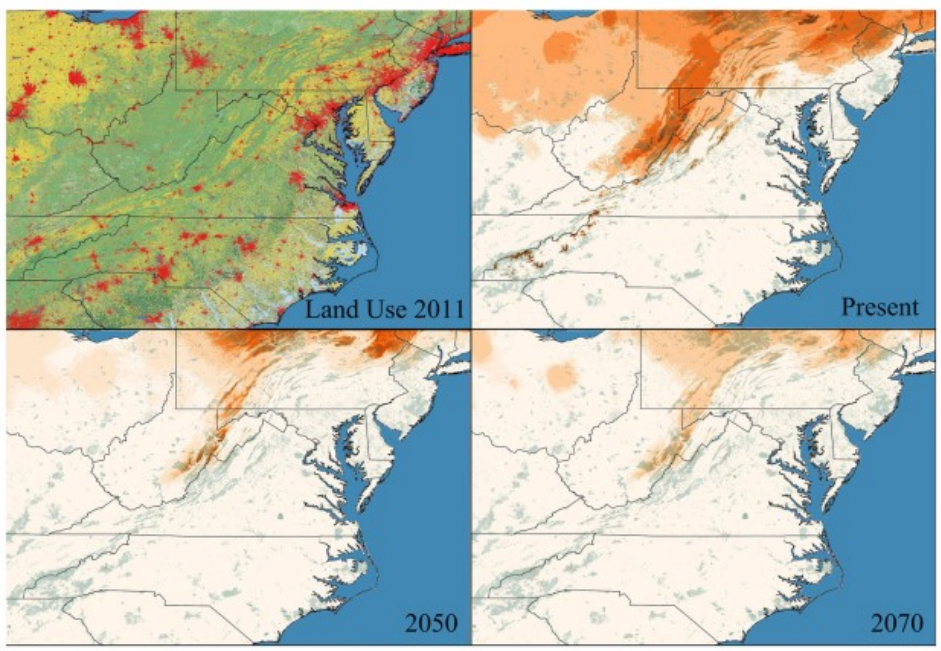

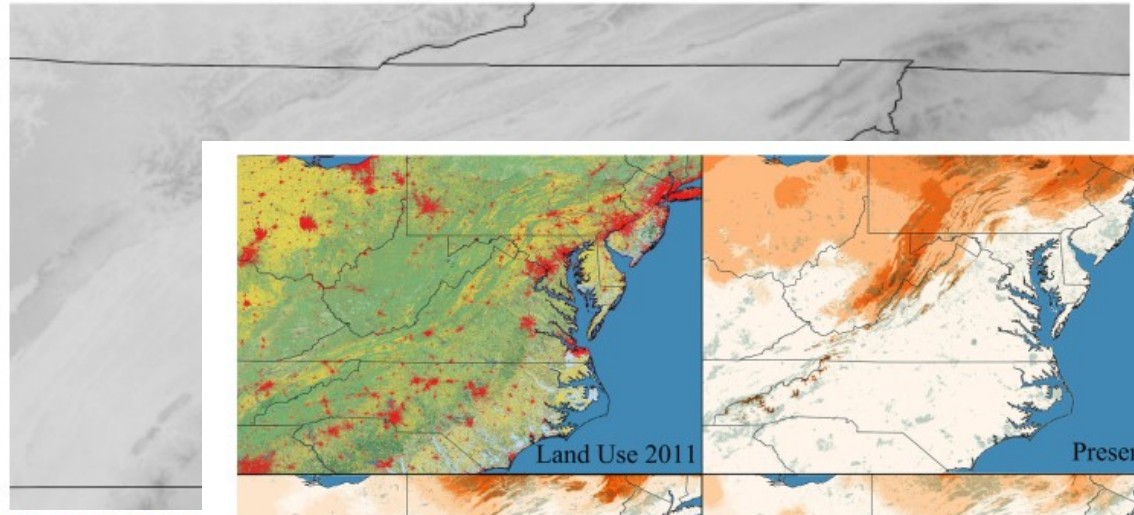

Dead end for endemic plant species? A biodiversity hotspot under pressure

Climate change impacts on endemic, high-elevation lichens in a biodiversity hotspot

CCSM4 2.6

HadGEM2-A

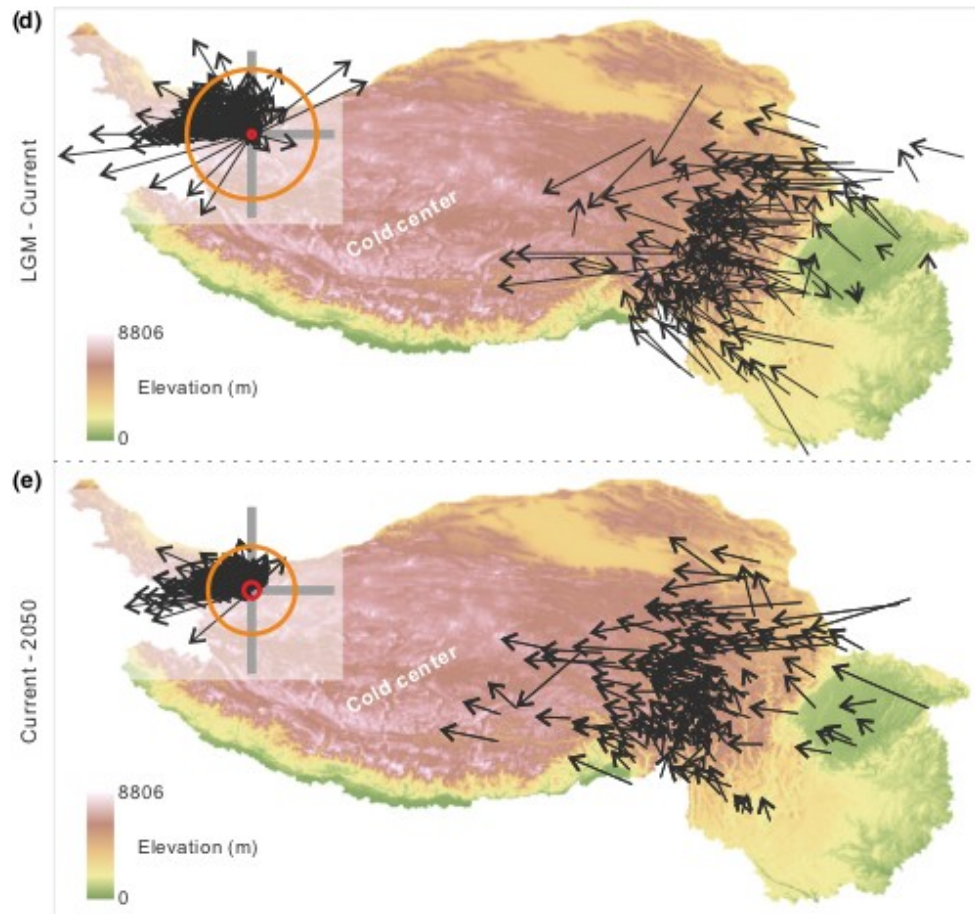

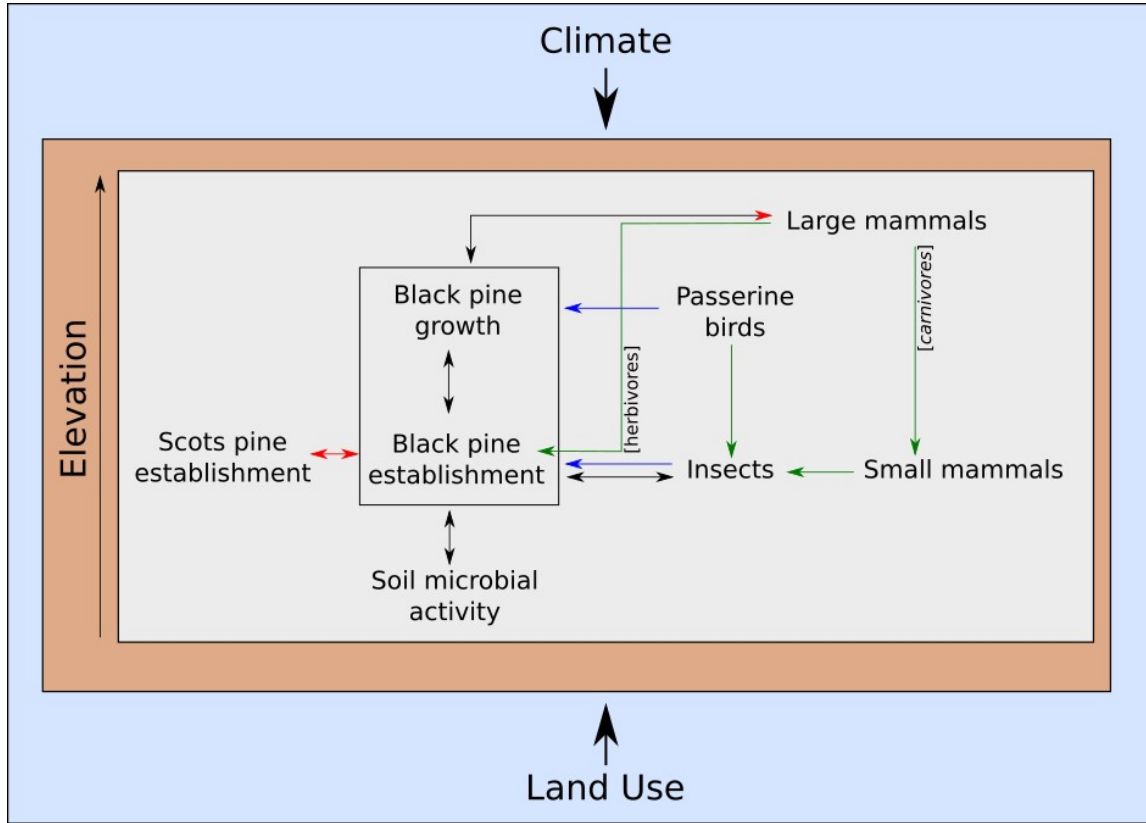

FIGURE 1 Change in the distribution of the climatic niche of 151 representative plants in the Hengduan Mountains and adjacent regions from the LGM to 2050 (RCP8.5). (a) Trend in change in mean elevation. (b) Trend in change in mean latitude. (c) Trend in change in mean longitude. “//” represents the long interval between the LGM and the current (about 21,000 years). (d and e) Distance (magnitude) and direction of change at the centroid of the climatic niche (represented by the arrows) over each period. The wind roses summarize the distance and direction of shift for all the studied plants during each period. The coloured rings on each wind rose represent the amplitudes of shift in distribution of climatic niche (orange) and the 10-year shift velocities for distribution of climatic niche (red). The grey axis bars on the wind roses are scaled to represent 400 km in length (from 0, 0 to tip) [Colour figure can be viewed at wileyonlinelibrary.com]

| Stressor | Increase | Decrease | No response |
|------------------------------------|--|--|--------------------------|
| Temperature | Plant growth rates Altitudinal shift | Population densities Range size | Altitudinal distribution |
| Global Climate Change | Extinction rates Altitudinal distribution | Population densities | Extinction |
| Lower precipitation | Extinction | Population densities | |
| Glacier reduction | Changes in abundance Extinction | Regional diversity | Extinction |
| Higher altitudinal distrib. | Altitudinal distrib. (birds) Extinction | Seedling abundance Species richness (birds) | Extinction |
